MRM 2.0 — Team KPI Roll-Up & HOD Performance Scoring

Product Requirements Brief for Masood — prepared by Suraj

Why This Extension Exists

The monthly MRM module Masood already built — tiles, objectives, plan versus actual, RAG entry, save — is live and working for HODs. What's missing is the layer underneath it: individual team members across every department are separately filling in day-wise KPI data, blockers, business loss, and open points, and today that data lives apart from the HOD-level MRM Suraj reviews each month. This extension closes that gap — it pulls team-member submissions up into a clustered, scored view inside the same MRM that HODs already present, so performance at every level, from the individual up to the HOD, is visible in one place.

The end goal: a monthly HOD MRM that shows team performance clustered by sub-team, colour-coded so Suraj can go straight to the red areas in his HOD meetings, feeding into an annual score that helps identify top and bottom performers for increments and coaching.

Current State — What Already Exists

- Team members already log day-wise KPI entries against their own personal list of task types (roughly seven to fifteen per person) — they flag and update whichever tasks occurred that day and save.
- At month end, each team member has a single “submit” action. This one submission bundles: the monthly total per task type (auto-summed from their daily entries), blockers faced that month, business loss (a rupee figure, with a text remarks field already present), and open points.
- Once submitted, the HOD reviews and clicks approve; it then reaches Suraj.
- KPIs themselves currently have no targets — they are raw counts of work completed, not measured against a plan.
- HOD-level MRM (tiles, objectives, plan versus actual, RAG, action plans) is already live and separately in use — this is where targets and RAG status currently exist.
- The MRM Open Points integration and annual rollup/forecasting module (auto-syncing action plans, approval-and-lock workflow, annual aggregation) is already underway as a separate, related build — business-loss annual aggregation should be handled by that same rollup, not rebuilt here.

What This Extension Adds

1. Sub-Team Clustering

Team members within a department are organised into named sub-teams (for example, under Import: a “DU” sub-team and a “Submission” sub-team, each with its own two or three people). Each sub-team's individual KPI submissions should be summed and clustered into a single segment view for that HOD, with the contributing team members' names shown in brackets under the segment. An HOD with five sub-teams should see five distinct segments, each rolling up its members' numbers, rather than one flat list of individuals.

2. Segment-Level RAG (Derived, Not Manually Set)

KPIs still carry no targets, so RAG at the segment level is not a manual entry — it is derived automatically from two signals together:

- Trend deviation — the segment's current-month output compared against its own historical average/trend.
- Presence of flags — whether blockers or business loss were reported for that segment that month.

A segment can turn red from either signal, or both. This lets an HOD (and Suraj) see at a glance, across all of an HOD's five-or-so sub-teams, which ones need attention that month — filterable to reds first, which is how Suraj runs HOD MRM meetings today.

Note: this segment-level RAG is distinct from the existing HOD-level MRM RAG, which already exists at the focus-area level where targets are set and plan-versus-actual is measured. Both should be visible together in the same HOD MRM view, but the logic behind each is different — one is target-based (existing), the other is trend-and-flag-based (new).

The segment view must show the HOD which of the two triggers caused a red status — trend deviation, a flagged blocker/business loss, or both — directly alongside the colour itself, not just the colour on its own. This lets the HOD walk into the MRM meeting already knowing why a segment is red, rather than having to dig for the cause.

Trend-deviation threshold: a segment is flagged red on the trend signal when its current-month KPI output falls 20 percent or more below its own trailing 3-month average; 10–19 percent below trend is amber. For the first three months after this extension goes live, a segment has no trend history to compare against — during that window, RAG runs on the flag signal alone (blockers/business loss reported or not), and the trend signal switches on automatically once three months of data exist.

Non-submission handling: if a team member has not submitted by the monthly deadline, their segment defaults to red for that month and is flagged accordingly in the HOD's view — it is not excluded from the roll-up. This keeps missed submissions visible rather than letting them silently drop out of the score.

3. Monthly HOD Performance Score

Each HOD receives one monthly score, calculated as a weighted blend:

Component	Weight
Team KPI performance (rolled up from all of the HOD's segments)	70 percent
HOD's own individual focus areas (existing MRM tiles/objectives)	30 percent

This score is what lets Suraj compare HODs against each other over time and, annually, identify the strongest and weakest performers for increment and coaching conversations.

4. Required Fields at Submission

Business loss, blockers, and open points are mandatory (non-blank) fields at the point of monthly submission — a team member cannot submit a blank month. Each of these three fields includes a “nothing to report” option as a deliberate, selectable answer for a clean month, distinct from leaving the field blank — this keeps the mandatory-field rule intact without turning an uneventful month into a forced, empty-feeling entry. The business-loss field carries a rupee amount with a text remarks field; the remarks field should function as a genuine recommendation/action note rather than free text, since this is the detail an HOD or Suraj will act on.

5. Annual Roll-Up (Handled by the Existing Rollup Module)

Business loss should aggregate annually the same way the existing MRM annual rollup module already handles other objectives — no separate build needed here. One addition: the annual business-loss figure should also reflect and roll up onto the HOD's own annual view, not just sit at the team-member or segment level, since HOD accountability for team business loss is part of the point of this extension.

Report Format — What the HOD MRM Should Show

For every team member, from the top of the department down to the individual, the monthly HOD MRM report should show:

Field	What It Shows
Plan vs. Actual vs. Variance	Existing focus-area fields at the HOD level — unchanged.
KPI numbers	Raw count of work completed per task type, rolled up per segment and per individual.
Blockers	As submitted monthly by the team member; visible per segment and per individual.
Workload / open points	Open points associated with the team member, as already captured at submission.
Action plan, responsible person, remarks	Existing MRM fields — unchanged.
Status (Red / Yellow / Green)	Existing at the HOD focus-area level (target-based); new derived version at the segment level (trend-and-flag-based), as described above.

Accountability — HODs and Escalations

HODs are accountable for resolving or escalating their team's blockers — an unresolved blocker that recurs month over month should be visible as a pattern, not buried in a single month's entry. Since the HOD's monthly score is directly tied to team KPI performance, an HOD has a direct incentive to chase down team members who are not submitting or who are consistently in the red, rather than that follow-up falling to Suraj by default.

To support this, the HOD's view includes a submission-status indicator visible before the monthly deadline — showing at a glance who on the team has and hasn't submitted yet — so an HOD can chase a late submission while there's still time to act, rather than discovering the gap only after the deadline has passed.

Summary

This extension takes team-member KPI data that already exists and gives it structure: clustered into named sub-team segments under each HOD, coloured automatically from trend and flags rather than manual entry, and rolled into a single monthly HOD score weighted 70/30 between team and individual performance. Every field that matters — blockers, business loss, open points, submission status, the reason behind a red — is visible in one place, with no separate reporting cycle and no open items left for Masood to resolve before scoping the build.
